

Link it all together in Metacoder

 assumed you have performed all previous steps successfully and have used the same names

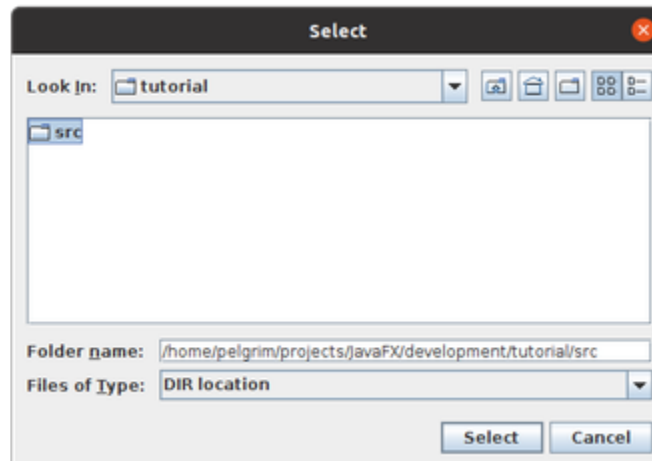

Open Metacoder

Select your new database

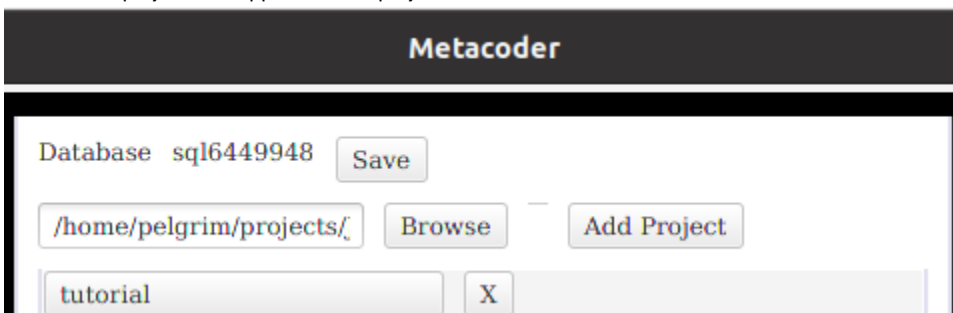

Select the Browse button and select the **source map** of the project.

Metacoder assumes the selected map is the source, and the parent map is the project map.

When selected, use Add Project button to confirm your selection.

Your tutorial project now appears in the project list

Select your project tutorial, and on the right panel select the metacode map we created, also called tutorial and select the Save button. This will generate or update an xml file in databases/projects with this configuration.
